1. Field of the Invention The present invention relates to a power supply control circuit for preventing power supply to a load circuit from being interrupted by a surge voltage.
2. Description of the Related Art A power supply circuit to supply a battery voltage to a load circuit of a camera is shown in FIG. 1. The power supply circuit comprises a plurality of terminals R, D, G and B. The terminal R is connected to one end of a DC power supply. The terminal D is connected to a ground. The terminals G and B are connected to a load circuit comprising a plurality of semiconductor devices. In the DC power supply, the terminal R is connected to the terminal D by a resistance and a diode. The diode is forward-biased when the battery voltage is higher than the forward voltage of the diode, and the diode is reverse-biased when the battery voltage is lower than the forward voltage of the diode. The diode and resistance series circuit are used so that a photo-cathode current of the diode always flows in the reverse direction. Accordingly, the battery voltage is supplied to the circuit comprising the diode and resistance in the reverse direction. The circuit thus constructed has a low power conversion efficiency because the forward current flowing through the diode is as small as the photo-cathode current, though a photo-electric cell comprising the diode is applied to the circuit. In addition, the current flowing through the diode is larger in the reverse direction than in the forward direction. In the circuit, the terminal D is 3e33713323
