November 2012, Autodesk announced plans to release "AutoCAD API for XML" which allows developers to access and use the information in AutoCAD drawings. App builder Developers can build add-ons for AutoCAD by using the App builder. As of AutoCAD 2012, it is available for Windows, macOS, Linux, iOS, Android and BlackBerry OS 10. There are more than 400 applications using the App

builder. Tagging The software provides several ways of tagging and managing objects, such as tagged objects, named and annotated objects, annotation layers, text blocks, and layers. AutoCAD contains a function for tagging multiple objects in one action, known as link objects. This works by linking two linked objects in the drawing by using the Group command. Also, AutoCAD has a grouping feature where each

---

grouped object is called a linked block, and the blocks can be linked to each other. The Blocks palette lists all linked blocks, and the user can select which linked blocks to be copied with the command Selection → Copy Blocks. A user can also create sub-groups from linked blocks by using the Group command. In AutoCAD, tags can be added to objects, as can layers. The Layers palette displays all layers,

---

including hidden layers. Layers can be filtered based on a property of the layer, such as layer type, tag type, layer visibility, etc. Layers can be grouped by using the Layer Groups palette. Other functions that AutoCAD provides to tag objects are named tags, named annotations, and named objects. A named tag can be used to assign multiple tags to an object. Named annotations are similar, except that they can be used for

---

individual text annotations on an object, or as tags. Named objects are similar, except that they can be used to specify properties of objects. AutoCAD contains a function for creating and editing tags in multiple objects, called Managed Tags. Managed tags are also saved as a XML file, which can be edited later. A tag is stored in the XML file in the form: a1d647c40b
